Computer Architecture Lab Session

4. Bomb Lab

2020/05/06 comparch@csap.snu.ac.kr

Overview

- Due: Wednesday, May 20, 11:00
- In this lab, you will find out what this bomb does by reading assembly code and defuse it by entering secret codes.
- Read the README carefully. It contains the full instructions of the lab. This is an overview with some tips.
- Unlike previous lab, you should get the bomb from url, not from the git.
- However you should fork the repository, make it private and update your report.

Downloading the Bomb

- Visit
 - https://csap.snu.ac.kr/comparch/bomblab/
- Fill in your name and student number to download your personalized bomb
- Save the bomb file to a directory of your choice, then extract the tar archive
- Bombs are custom-built, i.e., each student gets a different bomb
- The folder contains a README file with the information you entered

Problem specification

Inspecting the Bomb's Source Code

- The source code for the main bomb file is provided. From this file, you can get important information on how the bomb runs.
- Open a terminal, cd into the bomb directory, and open the bomb. The example below uses the vi editor; if you are not comfortable with vi you can use any other editor:

```
jiyeon@gentoo ~/02.Bomblab/bombs $ tar xvf bomb1.tar
bomb1/bomb
bomb1/bomb.c
bomb1/README
jiyeon@gentoo ~/02.Bomblab/bombs $ cd bomb1
jiyeon@gentoo ~/02.Bomblab/bombs/bomb1 $ cat README
This is bomb 1.

It belongs to 2020-12345 (test)
jiyeon@gentoo ~/02.Bomblab/bombs/bomb1 $ vi bomb.c
```

Inspecting the Bomb's Source Code

- In the main function, find the code that reads and checks the input for each phase.
 In the example below, the code for phase_1
- We see that the input string is stored in variable input which is then used as an argument for the function phase_1.
- We conclude that it might be a good idea to have a closer look at the function phase_1.

```
printf("Welcome to my fiendish little bomb. You have 6 phases with\n");
69
70
       printf("which to blow yourself up. Have a nice day! \n");
71
72
       /* Hmm... Six phases must be more secure than one phase! */
       input = read_line();
73
                                       /* Get input
                                        /* Run the phase
74
       phase_1(input);
       phase_defused();
                                        /* Drat! They figured it out!
75
                                         * Let me know how they did it. */
76
       printf("Phase 1 defused. How about the next one?\n");
77
```

Running the Bomb

 First, let's see what happened when we run the bomb. Maybe we can guess the input string.

Let's try "test":

```
jiyeon@gentoo ~/example $ ./bomb
Welcome to my fiendish little bomb. You have 1 phases with
which to blow yourself up. Have a nice day!
test
BOOM!!!
The bomb has blown up.
jiyeon@gentoo ~/example $
```

Hmmm...this is not going to work

Disassembling the Bomb using objdump

- **objdump** can display the bomb's symbol table (contains names of functions, variables, and other symbols) and also disassemble the code of the bomb.
 - save the symbol table by executing
 objdump –t bomb > bomb.sysbols
 - disassemble the bomb's code and save it to bomb.disas by executing
 objdump –d bomb > bomb.disas

```
jiyeon@gentoo ~/example $ objdump - t bomb > bomb.symbols
jiyeon@gentoo ~/example $ objdump - d bomb > bomb.disas
jiyeon@gentoo ~/example $
```

Inspecting the code of phase_1

Open the disassembled code in a text editor and locate phase_1

```
00000000000012a0 <phase 1>:
200
        12a0: 53
                                      push
                                             %rbx
201
        12a1: 48 83 ec 10
                                      sub
                                             $0x10, %rsp
202
                                             %rdi, %rbx

        12cd: 5b
                                             %rbx
                                      pop
213
        12ce: c3
                                      retq
214
        12cf: e8 c9 05 00 00
                                      calla
                                             189d <explode_bomb>
                                             12c9 <phase_1+0x29>
215
        12d4: eb f3
                                      jmp
216
217 00000000000012d6 <phase_2>:
                                                                            ~/example/bomb.disas
173: 46 [ 18%]
/phase 1
```

Inspecting the code of phase_1

From the code we can see that:

```
push
       %rbx
sub
       $0x10, %rsp
       %rdi, %rbx
mov
callq 1745 <phase init>
callq 1745 <phase_init>
       0x8( %rsp), %rsi
lea
       %rbx. %rdi
mov
callq 1955 < read two numbers>
       0xc(%rsp), %eax
mov
       %eax, 0x8( %rsp)
cmp
       12cf <phase 1+0x2f>
       $0x10, %rsp
add
       %rbx
pop
retq
callq
       189d <explode bomb>
       12c9 <phase 1+0x29>
jmp
```

phase_1 calls a function called
read_two_numbers with two
arguments

then, depending on the result of read_two_numbers, either calls explode_bomb or returns.

Debugging the Bomb in gdb

- With this knowledge we now run the bomb in the GNU debugger
- go back to the terminal and execute gdb bomb
- set a breakpoint at phase_1 by entering break phase_1
- run the bomb by enteringrun
- enter the string
- now gdb stops at the entry of phase_1 (disassemble with disas)

```
jiyeon@gentoo ~/example $ gdb bomb
GNU gdb (Gentoo 8.3 vanilla) 8.3

Reading symbols from bomb...
gdb) break phase_1
Breakpoint 1 at 0x12a0
gdb) run
Starting program: /home/jiyeon/example/bomb
Welcome to my fiendish little bomb. You have 1 phases with
which to blow yourself up. Have a nice day!
hello
Breakpoint 1, 0x00000555555555200 in phase 1 ()
(gdb)
```

Stepping through the Code

The command step executes the C code line-by-line

```
(gdb) run
Starting program: /home/jiyeon/example/bomb
Welcome to my fiendish little bomb. You have 1 phases with
which to blow yourself up. Have a nice day!
hello

Breakpoint 1, 0x000055555555552a0 in phase_1 ()
(gdb) step
Single stepping until exit from function phase_1,
which has no line number information.

BOOM!!!
The bomb has blown up.
[Inferior 1 (process 24878) exited with code 010]
(gdb) ■
```

- the C code for phase_1 is not available, so gdb executed the function phase_1 until
 the end
 - not really what we wanted...

Stepping through the Code

- We can set more breakpoints and continue execution until the next breakpoint is reached. Looking at the code, a breakpoint at function read_two_numbers seems reasonable.
 - breakpoints to addresses are setby entering break *<address>
 - continue execution to the nextbreakpoint with cont (or simply c)
- Now, single-step instruction-by-instruction through the code by executing stepi
 - step: step through the program line-by-line
 - stepi: step through the program one (machine) instruction exactly

```
gdb) stepi
            555281 in phase_1 ()
                   in phase 1 ()
Dump of assembler code for function phase_1:
                                  push
                       <+1>:
                                  sub
                                         $0x10, %rsp
                                         %rdi. %rbx
                                  mov
                                  callq 0x5555555555745 <phase_init>
                       <+13>:
                                  callq 0x5555555555745 <phase_init>
                       <+18>:
                                  lea
                                         0x8( %rsp) , %rsi
                       <+23>:
                                         %rbx, %rdi
                                  mov
                       <+26>:

                                         0x5555555552c9 <phase_1+41>
End of assembler dump.
qdb) break *0x5555555555555
Breakpoint 2 at
 gdb) break read two numbers
Note: breakpoint 2 also set at pc 0x5555555555555.
Breakpoint 3 at
```

- After executing s at the call to read_two_numbers, enter disas again to see where we currently are.
- as expected, the debugger stopped at the first instruction of read_two_numbers
- from the name we guess that the function probably read two numbers. The code confirms this assumption: it first calls the **sscanf** with using address from rsi as first argument(%rdx). If the return value(number of scanned values) is less or equal than 1, it call explode_bomb.

```
$0x8, %rsp
